React and TypeScript are where I spend most of my time, building interfaces and the layers that back them. At Trailr AI I worked on a live product with real users, shipping features as the platform grew. At Bevisly I built a full-stack SaaS from a blank repo: PostgreSQL schema design, Supabase auth, AI integration via edge functions. I write tests, care about whether things feel right to use, and try to think about the person on the other side of the screen.

Areas of expertise:

Technical: React | Next.js | TypeScript | JavaScript | HTML & CSS | TailwindCSS | Zustand | Vitest | Supabase | PostgreSQL | Node.js | REST APIs | Git & GitHub | CI/CD | Figma

Craft & Practice: Component Architecture | Design Systems | Accessibility (WCAG) | Performance Optimization | Agile/Scrum | Cross-functional Collaboration

AI Integration: LLM integration, edge functions, AI-powered feature development, AI-assisted engineering

Experience:

Trailr-AI

Sep 2025 - Present

Frontend Developer → Partner (Equity)

Remote, Denmark

- Working within an existing React + Zustand codebase, I took on a full overhaul of the platform's navigation UI, reworking state connections and wiring components to fit new design requirements.
- Most work arrived as rough briefs with no formal specs; I'd interpret the intent, flag feasibility gaps early, and work toward components that matched what the team had in mind.
- Joined when the product was still pre-launch and shipped features continuously as it found its shape; the platform now has real clients.
- Came in as an intern and, over time, was offered equity through a signed shareholder agreement.

Bevisly

Aug 2025 -

Present

Solo Builder & Founder

Copenhagen, Denmark

- Full stack from a blank repo: React + TypeScript on the frontend, PostgreSQL schema design, Supabase auth with Row-Level Security, data isolation enforced at the database layer rather than the application.
- The Kanban board needed to feel right to use. I built custom @dnd-kit collision detection with a column-first intersection strategy and a 6px activation constraint to address the drag jitter that tends to make these interfaces feel broken.
- The API layer between React and Supabase is typed throughout, with separate auth flows covering employer and candidate roles.
- Gemini 2.5 Flash runs via Deno edge functions for feedback generation, job listing drafting and practice proof grading. Playwright E2E tests cover both candidate and employer flows.

Satoshi Standard

Aug 2025 - Sep 2025

Solo Build

Copenhagen, Denmark

- The dashboard includes a portfolio tracker where users save assets, track purchasing power over time and visualise fiat leak via Chart.js.
- Live Bitcoin price data in React and Tailwind, with controlled re-renders to keep updates smooth without hammering the UI.
- A cryptoApi adapter module (setProvider()) abstracts CoinGecko, Mempool and CoinCap behind a single interface, so the provider can switch at runtime independently of the UI layer.
- Vitest covers the API adapter layer, UI components and core conversion logic.

Millennial Consulting

Sep 2023 - May 2025

Head of Organization, Volunteer -> promoted from Head of Operations

Copenhagen, Denmark

- 25+ client engagements across 4 cycles, 90%+ satisfaction each time. The role grew from Head of Operations to Head of Organization over that period.
- Recruitment, client relations, budget and external firm partnerships all ran through me, keeping each cycle fully resourced with no full-time staff.

Education:

Jensen Yrkeshögskola

Aug 2024 - May 2026

Professional Bachelor's degree in Frontend Development

Malmö, Sweden

Uppsala University

Aug 2022 - June 2023

MSc in Business and Management - Entrepreneurship

Uppsala, Sweden

Uppsala University

Aug 2019 - June 2022

BA in Game Design and Project Management

Uppsala, Sweden
